Not illustrated. 1900 Excerpt: . . . the argument of which lies between 0 and $27r$, then $11 \log 11$ $11 \log t$ $4-12kiri$, where h is a finite integer on account of the properties of the curve drawn through t from 0 to t_0 . Now t^{2k7Tl} is small compared with $11 \log t$ when i is small. Also $11 \log t r$ $(\log r)^2$ 6 where $t r$; that is, when r is very small, $11 \log 11$ differs from $r \log r$ by a quantity infinitesimal compared with its value; moreover, this value can be made smaller than any finite quantity, on sufficiently diminishing r . From the foregoing equation, it therefore follows that $v \log t$. . . , where the unexpressed parts are powers of t , of $t \log t$, and of combinations of their powers; the term retained is the most important term, for $t \log t$ $t \log t$ \log . In particular, if we choose the branch \log of the logarithmic function, we have $v \log t$. . . $\log t$ V , where V can be made less than any assignable finite quantity on sufficiently diminishing t , and is at the same time infinitesimally small compared with $11 \log 11$. 71 . To establish the first theorem in 70 , it would be possible to pass from the equation t where $x(v, t)$ is a regular function of v and t , to the more extended theorem dealing with the general character of v in a finite region...
